

Hi Eva,

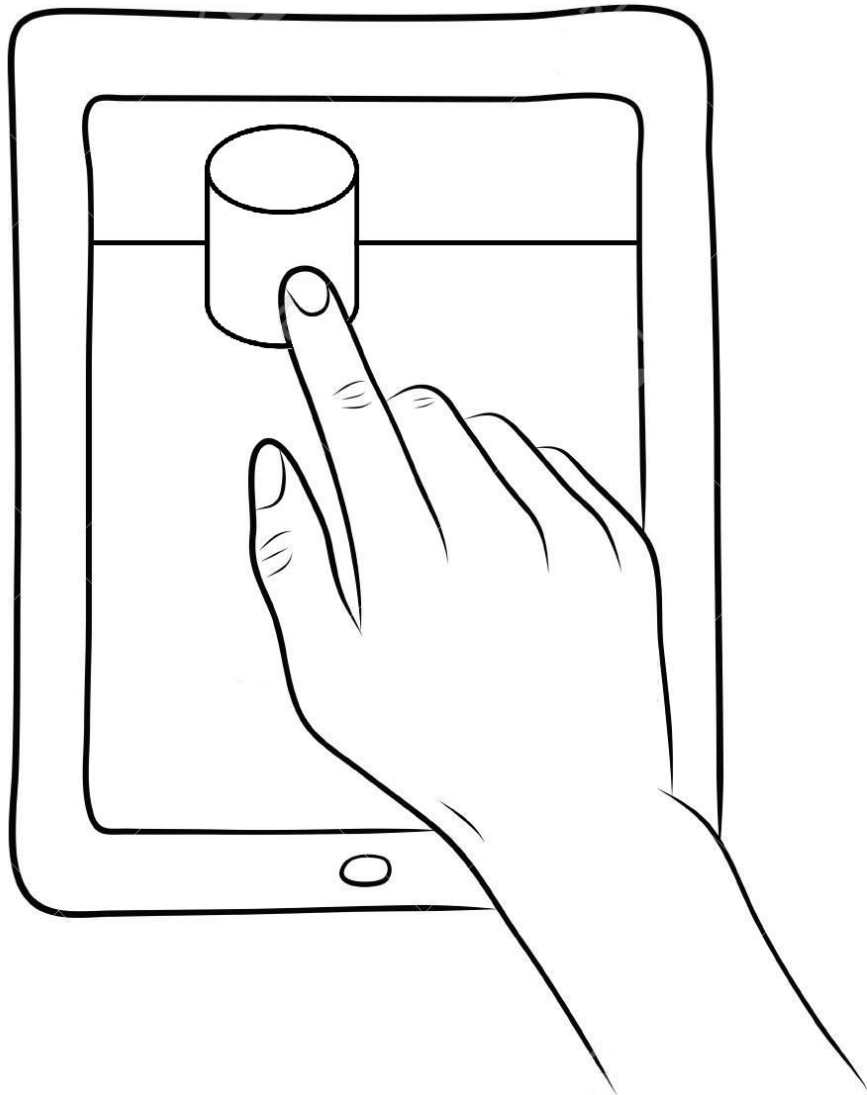

Thanks for your quick reply. In this document I briefly described what my goal is.

I would like to create a way to use the instant tracking with freehand drawing.

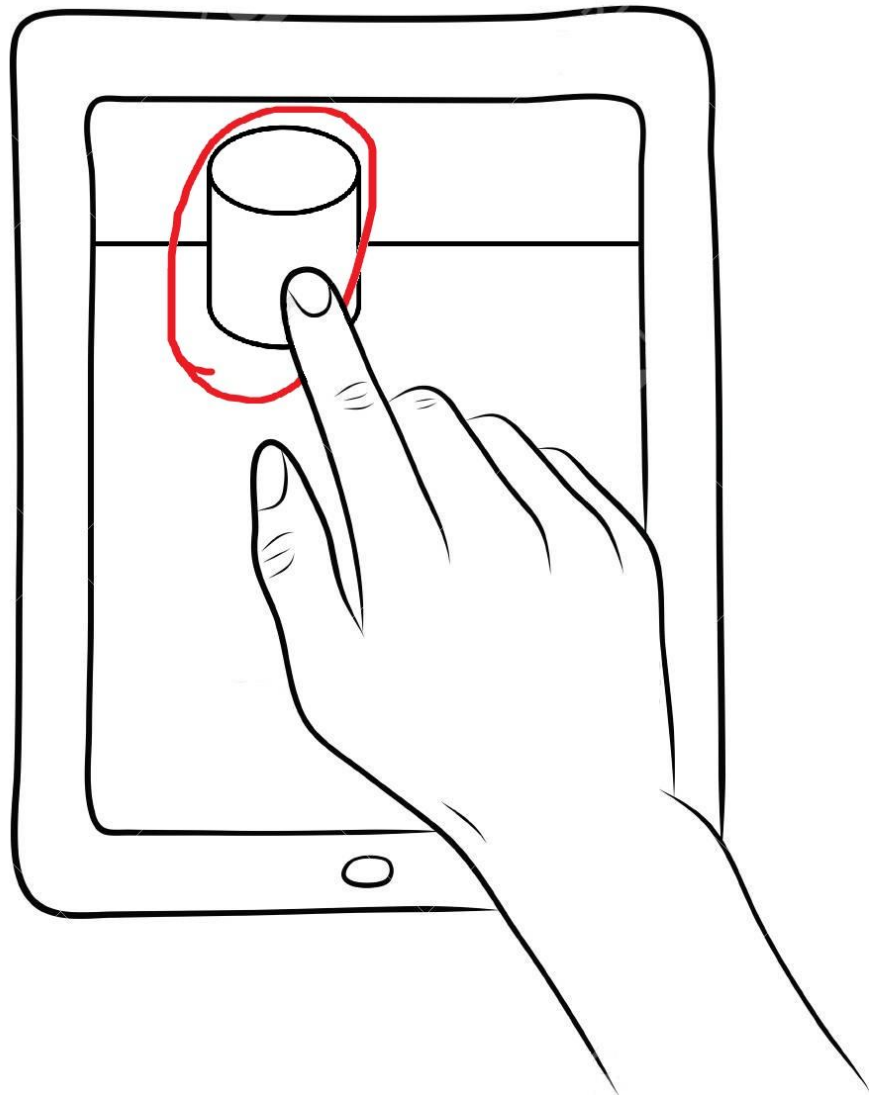

Below what I mean.

1) Starting the scanning.

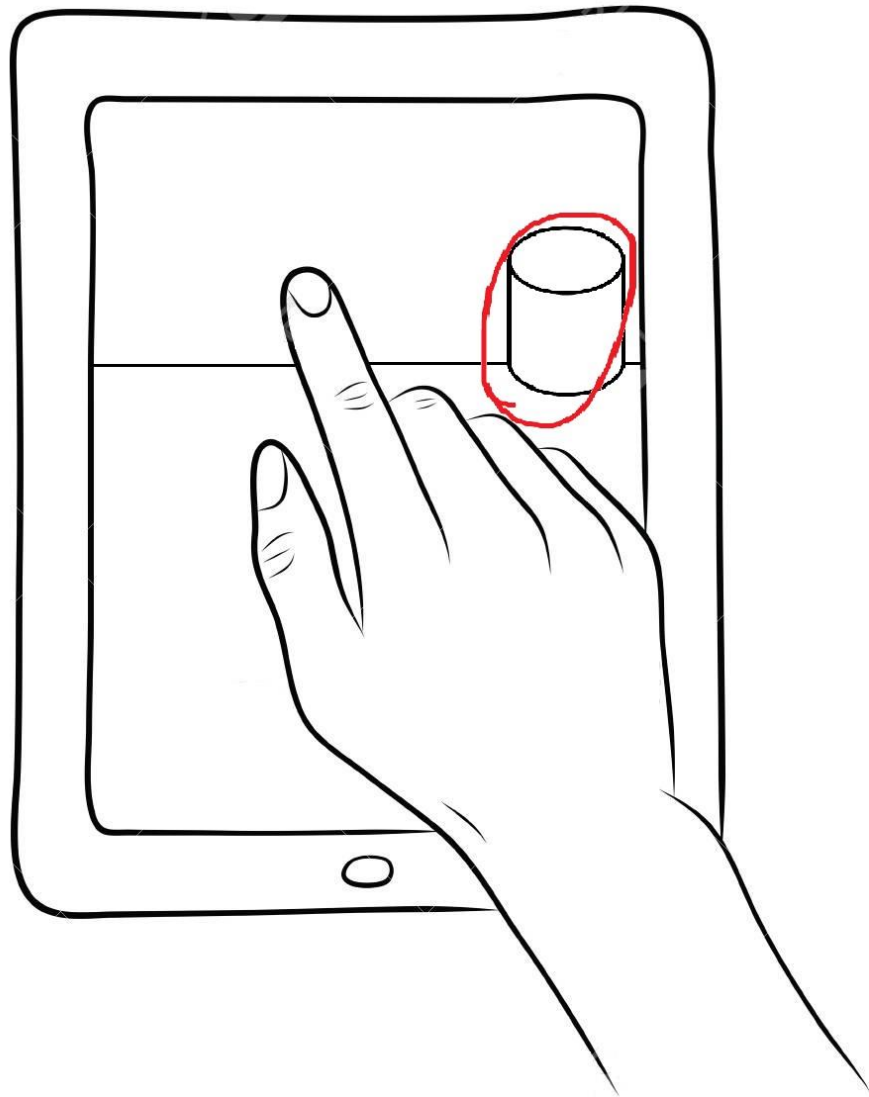

```
tracker.state = AR.InstantTrackerState.TRACKING
```

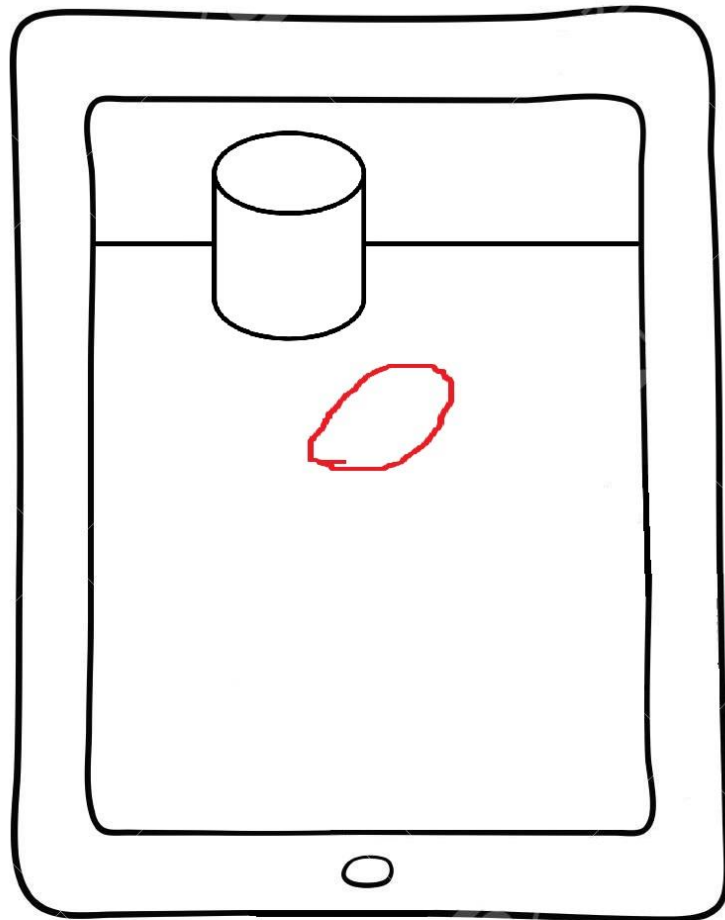

2) Starting the freehand drawing with html canvas.

3) At the end of the drag I would like the image of my canvas to be anchored in the same position in which I placed it, as you can see below.

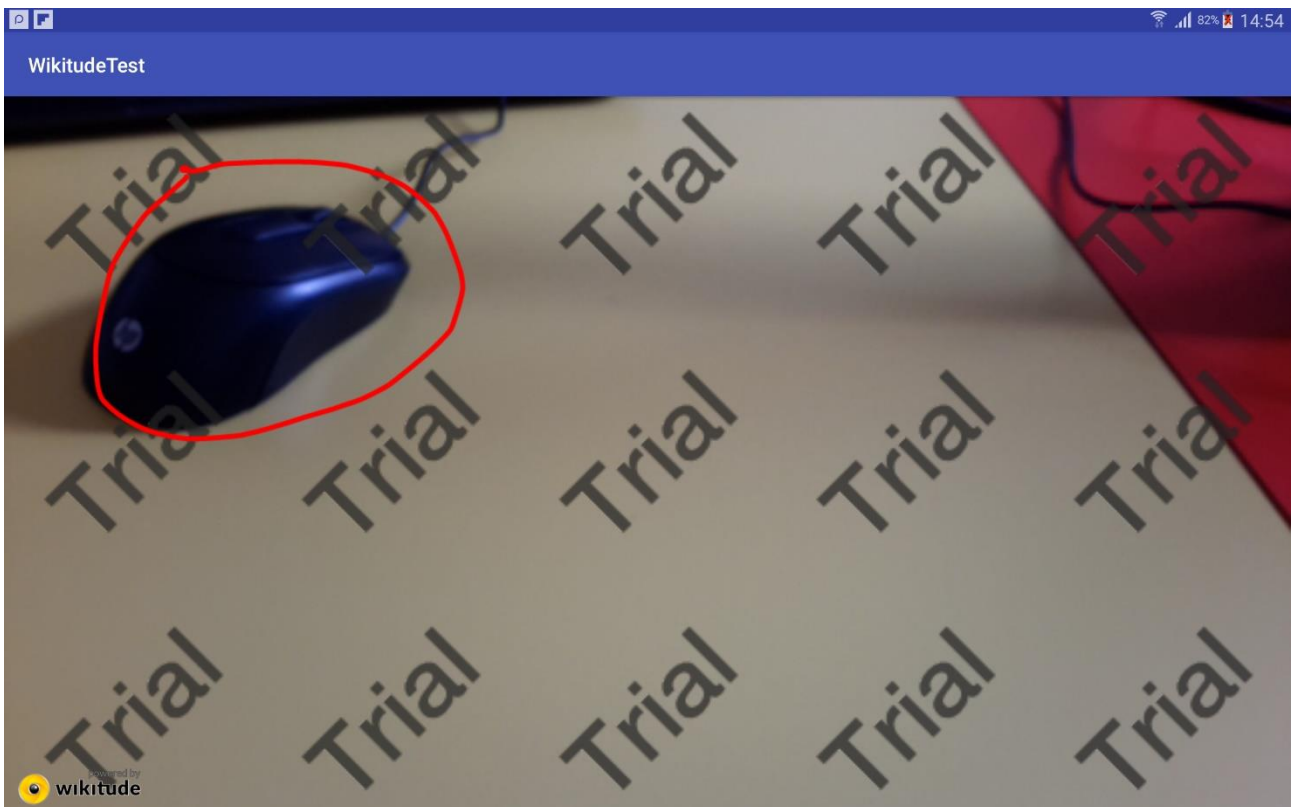

- 4) Instead, when I up my touch, the canvas image is placed and anchored at the center of the screen with different dimensions and perspectives.

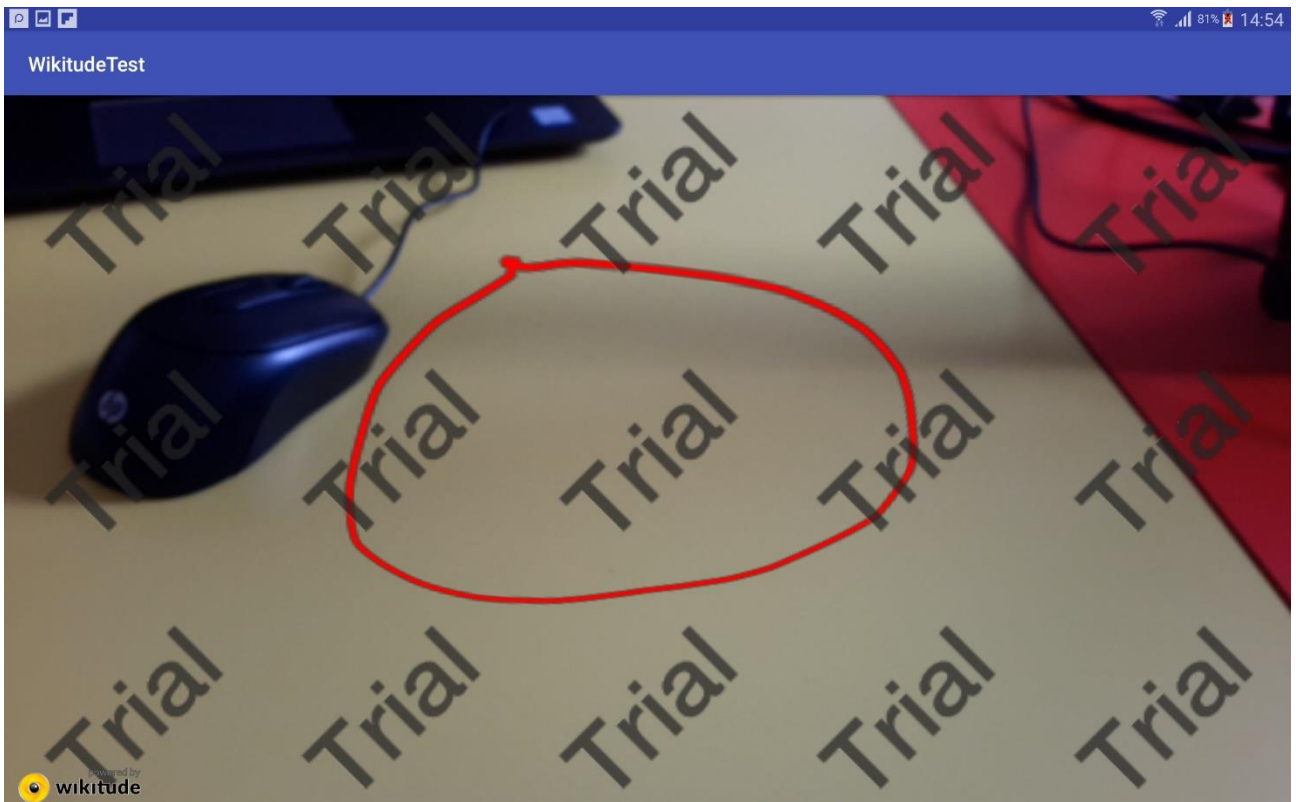

Following an example:

1) During the drawing.

2) At the end of the drawing, when I up the touch.

I hope I have explained it clearly. Could you send any suggestions to reach my goal?

Thanks in advance.

Best regards

Michele Trombacca
